Foto Challenge Sync Integration Guide

Overview

This guide explains how to integrate the automatic challenge synchronization feature into your Foto Next.js application. The chatbot will now automatically save generated photography challenges to your dashboard at `https://myfoto.topues.com`.

What's Been Updated

1. Chatbot Model (Abacus.AI)

- **Model ID**: `395b215e`
- **New Version**: `158402f8ca`
- **Deployment**: Active at `https://apps.abacus.ai/chatllm/13a86b8346`
- **New Capability**: Automatically detects challenge requests and embeds structured metadata in responses

2. Frontend Integration Script

- **File**: `challenge-sync.js`
- **Purpose**: Monitors chatbot messages, extracts challenge data, and syncs to dashboard
- **Location**: Should be placed in `/public` directory of your Next.js app

Integration Steps

Step 1: Copy the Sync Script

```
# Copy challenge-sync.js to your Next.js public directory
cp challenge-sync.js ~/foto_app/nextjs_space/public/
```

Step 2: Update Your Chat Page

Add the script to your chat page component. Update `pages/chat.js` (or wherever your chat page is):

```
import Script from 'next/script';

export default function ChatPage() {
  return (
    <div>
      {/* Your existing chat page content */}
      <iframe
        src="https://apps.abacus.ai/chatllm/13a86b8346"
        style={{ width: '100%', height: '100vh', border: 'none' }}
      />

      {/* Add the challenge sync script */}
      <Script
        src="/challenge-sync.js"
        strategy="afterInteractive"
      />
    </div>
  );
}
```

Step 3: Test the Integration

1. Start your Next.js development server:
   `bash`
   `cd ~/foto_app/nextjs_space`
   `npm run dev`

2. Open your chat page in a browser

3. Ask the chatbot for a challenge:
   - “Give me a photography challenge”
   - “What should I shoot today?”
   - “Create a street photography exercise”

4. Watch for:
   - Console logs: `[Foto Challenge Sync] ...`
   - Success notification: “✅ Challenge saved to your dashboard!”
   - Challenge appearing on your dashboard at `https://myfoto.topues.com`

How It Works

Challenge Detection

The chatbot automatically detects when you’re requesting a photography challenge based on keywords like:
- “challenge”
- “exercise”
- “what should I shoot”
- “give me an assignment”

Data Extraction

The chatbot embeds structured data in its response:

```
CHALLENGE_SYNC_DATA:
{
  "userId": "1",
  "challengeText": "Capture the interplay of light and shadow...",
  "category": "Street",
  "difficulty": "Mini",
  "duration": "30-45 mins",
  "location": "Melbourne CBD",
  "recommendedGear": ["Ricoh GR IIIx", "Fujifilm X-T5"],
  "tips": "Look for strong directional light...",
  "weatherConditions": "Partly cloudy, golden hour"
}
```

API Sync

The frontend script:
1. Monitors chatbot messages using MutationObserver
2. Extracts the `CHALLENGE_SYNC_DATA` JSON
3. POSTs to `https://myfoto.topues.com/api/challenges/sync`
4. Shows success/failure notification

API Payload Structure

```
{
  "userId": "1",
  "challengeText": "Full challenge description",
  "category": "Street|Portrait|Landscape|Macro|Architecture|etc.",
  "difficulty": "Micro|Mini|Deep Dive",
  "duration": "15-20 mins|1-2 hours|etc.",
  "location": "Specific location if mentioned",
  "recommendedGear": ["Gear item 1", "Gear item 2"],
  "tips": "Pro tips for the challenge",
  "weatherConditions": "Weather info if relevant"
}
```

Troubleshooting

Challenge Not Syncing

1. **Check Console Logs**:
   - Open browser DevTools (F12)
   - Look for `[Foto Challenge Sync]` messages
   - Check for errors

2. **Verify API Endpoint**:
   `bash`
   `curl -X POST https://myfoto.topues.com/api/challenges/sync \`
   `-H "Content-Type: application/json" \`
   `-d '{"userId":"1","challengeText":"Test"}'`

3. **Check Script Loading**:
   - Verify `challenge-sync.js` is in `/public` directory
   - Check Network tab in DevTools for 404 errors

Notification Not Showing

1. Check if notification is blocked by other elements (z-index)
2. Look for JavaScript errors in console
3. Verify the notification CSS is being applied

Duplicate Syncs

The script prevents duplicates using `data-foto-synced` attribute. If you see duplicates:
- Clear browser cache
- Check for multiple script instances
- Verify MutationObserver is working correctly

Testing Prompts

Try these prompts to test the integration:

1. **Basic Challenge**:
   - “Give me a street photography challenge”
2. **Location-Specific**:
   - “Create a challenge for Melbourne CBD”
3. **Gear-Specific**:
   - “Give me a challenge using my Ricoh GR IIIx”
4. **Difficulty-Specific**:
   - “Give me a quick 15-minute micro challenge”
   - “Create a deep dive challenge for the weekend”
5. **Category-Specific**:
   - “Give me a portrait photography exercise”
   - “Create a landscape challenge”

Configuration

Change User ID

Edit `challenge-sync.js`:

```
const USER_ID = '1'; // Change to your user ID
```

Change API Endpoint

Edit `challenge-sync.js`:

```
const SYNC_API_URL = 'https://your-domain.com/api/challenges/sync';
```

Customize Notifications

Modify the `showNotification` function in `challenge-sync.js` to change:
- Position
- Colors

- Duration
- Animation

Next Steps

1. ✅ Copy `challenge-sync.js` to your Next.js `/public` directory
2. ✅ Update your chat page to include the script
3. ✅ Test with various challenge prompts
4. ✅ Verify challenges appear on your dashboard
5. ✅ Monitor console logs for any issues

Support

If you encounter issues:
1. Check the console logs for detailed error messages
2. Verify your API endpoint is accessible
3. Test the chatbot directly at `https://apps.abacus.ai/chatllm/13a86b8346`
4. Ensure your dashboard API is accepting POST requests
